PT Drawin 22: presponytes fradiae tylactone synthase domain - for production of tylosin related polyketide compounds
Claim 22: press 18-197; 220pp; English.

This sequence represents a hybrid gene of the invention. This sequence careful from tylg ORFI. The position of the nucleotides from Ecorl: Siul fragment from tylg ORFI. The position of the nucleotides from Ecorl: Siul fragment from tylg ORFI. The position of the nucleotides from Ecorl: Siul fragment from Streptomyces ambofaciens, and encodes the platenolide. Platenolide is the basic building block of the macrolide antibiotic spiramycin. The tylg gene (see T80413) is the tylactone antibiotic spiramycin. The tylg gene (see T80413) is the tylactone was isolated from Streptomyces fradiae, and encodes multifunctional proteins which direct the synthaesis of the polyketide tylactone. Tylactone is the basic building block of the antibiotic tylosin. The hybrid sequence can be used to transform S. ambofaciens lacking the sing ORFI sequence, or S. fradiae lacking the tylg ORFI sequence, so that they can produce polyketides. The DNA sequence can be modified so as to alter the type of carboxylic acids nocyporated, the number of carboxylic acids incorporated and/or the post-condensation reactions performed, thereby resulting in novel tylosin related polyketides.

PT for production of spiramycin-related polyketide antiblotics

DNA encoding Streptomyces ambofaciens platenolide synthase domain -

for production of spiramycin-related polyketide antiblotics

DNA encoding Streptomyces ambofaciens. This sequence encodes the

Inis sequence represents the platenolide synthase gene cluster of the

convention. This sequence is referred to as the srm6 gene, and was

convention. This sequence is referred to as the srm6 gene, and was

convention. This sequence is referred to as the srm6 gene, and was

continion of proteins which direct the synthasis of the polyketide

platenolide. Platenolide is the basic building block of the macrolide

contibiting antiblotic activity based on the platenolide structure,

including specifically the macrolide antiblocic spiramycin and spiramycin

contourned and derivatives. Modifications of the platenolide synthase DNA

conalogues and derivatives. Modifications of the platenolide synthase DNA

conalogues and derivatives. Modifications of the platenolide synthase DNA

conalogues and derivatives proving polyketide chain and to change the

coids incorporated into the growing polyketide chain and to change the

conds incorporated into the growing that is conducted.

conds incorporated solve the platenolide structure,

conds incorporated into the growing that is conducted.

conds incorporated into the growing that is conducted.

Displaying the production of tylosin-related polyketide compounds

From production of tylosin-related polyketide compounds

Example 2; Pages 110-134; 220pp; English

Frample 2; Pages 110-134; 220pp; English

This sequence represents the platenolide synthase gene cluster of the related from Streptomyces ambofaciens. This sequence encodes the nuttion. This sequence is referred to as the srmG gene, and was isolated from Streptomyces ambofaciens. This sequence encodes the platenolide. Platenolide is the basic building block of the macrolide antibiotic spiramycin. This sequence was used along with the tylG gene (see T80413) to create a hybrid ORF! sequence (see T80415). The tylG gene (see T80413) to create a hybrid orgic sequence (see T80415). The tylG gene (see T80413) to create a hybrid orgic sequence (see T80415). The tylG gene (sequence was isolated from Streptomyces fradiae, and encodes multifunctional proteins which direct the synthesis of the polyketide tylosin. The hybrid sequence can be used to transform 5. ambofaciens lacking the srmG ORF! sequence, or S. fradiae lacking the tylG ORF!

Sequence, so that they can produce polyketides. The DNA sequence can be modified so as to alter the type of carboxylic acids incorporated, the number of carboxylic acids incorporated, the number of carboxylic acids incorporated and/or the post-condensation of carboxylic acids incorporated and or content of carboxylic acids incorporated and content of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ŧ,

Mycobacterial infection

Glam 3; Fig 3; 48pp; English.

A BGG DNA fragment (T04154) that complemented a dapB mutation in Escherichia coli was isolated. The BGC dapB gene encoded a bifunctional enzyme (R79946) capable of catalyzing the dinydrodipicolinate-reductase and diaminopimelate-dehydrogenase reactions involved in diaminopimelic acid (DAP) blosynthesis. DAP biosynthetic genes are useful as targets for anti-mycobacterial agents and for the design of in vivo selection systems. Mycobacterial having a deleted dapB gene can be used for vaccine produ.

Phenazine gene cluster.

Pyrrolnitrin; blosynthetic pathway; pathogen protection; phenazine; plant antipathogents substance production; anti-fungal antibiotis; fungal respiratory electron transport inhibitor; lipoprotein damage; ss.
                                                          Protecting plants against pathogens with genetically transformed biological control agent - which expresses all polypeptide(s) involved in pyrrolnitrin biosynthetic pathway bxample 18: Column 135-144; 8Bpp; English.

Example 18: Column 135-144; 8Bpp; English.

This genomic DNA sequence encodes a cluster of genes involved in phenazine biosynthesis. Phenazines are nitrogen-containing heterocyclic compounds with a common planar aromatic tricyclic structure. It has been proposed that phenazine antibiotic function arrises from the formation of intercalative complexes with DNA interfering with DNA metabolism. Transgenic plants containing such antipathogenic genes should have enhanced resistance to attack by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Van Pee K, WPI, 98-56391/47.

pyrrolnitrin gene region of the invention, that encodes at least one enzyme required in the biosynthetic pathway of pyrrolnitrin. The DNA and construct cells transformed with it are useful for the production of transgenic plants with protection against phytopathogens. The enzymes are part of a biosynthetic pathway producing plant antipathogenic substances (AFS). The compound ultimately produced by the pathway, pyrrolnitrin, is a broad range, anti-fungal antibiotic. It inhibits tungal respiratory electron transport and causes general lipoprotein damage. The transformed cells can additionally be used in compositions to be applied to plants to provide resistance, as can purified AFS produced by them. Transgene dependent resistance eliminates the need to spray crops with chemical based pesticides and antibiotics, which is expensive antibiotics, their over use leads to resistance. In addition, transgenic production of these enzymes overcomes problems of applying and in addition and isolated in their growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pseudomonas fluorescens phenazine gene cluster.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A genetically engineered biocontrol strain of Pseudomonas has been developed that can control attacks on crop plants by pathogenic fungi, developed that can control attacks on crop plants by pathogenic fungi, acteria and microflora in the plant rhizosphere. The strains can be acteria and microflora in the plant rhizosphere. The strains can be included with agronomically acceptable carriers or chemical fungicides (e.g. metalaxyl compounds) in biocontrol compositions. The strains or compositions can be applied to a plant/plant part to protect it from a plant pathogenic fungus, by controlling or inhibiting fungal growth. They can also be applied to the environment in which a plant pathogenic fungus will grow (e.g. soil) to similarly control or inhibit pathogenic fungus. They are especially effective against plants pathogenic fungus. They are especially effective against plants of the control or inhibit pathogenic fungus. They are especially effective against shizoctonia also infects many other crop species (e.g. beans and wheat), and no effective chemical fungicides are available. The present sequence represents the Pseudomonas fluorescens phenazine gene cluster used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               125-JUN-1999 (first entry)
Human secreted protein 5' EST SEQ ID NO: 109.
Human secreted protein EST; expressed sequence tag; diagnosis;
forensic, gene therapy; chromosome mapping; signal peptide;
upstream regulatory sequence; cytokine activity; cell proliferation;
differentiation; haematopoiesis regulation; tissue growth regulation;
reproductive hormone regulation; chemotactic; chemokinetic; haemostatic;
thrombolytic; anti-inflammatory; tumour inhibition; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               which may have cytokine, immune, regulatory, haematopoiesis regulating, anti-inflammatory or tumour inhibition activity claim 1; Page 256, 577p; English.

X51787 to X52019 represent 5 expressed sequence tags (ESTs) for human secreted proteins, and encode the proteins given in Y12987 to Y13219, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated brain-derived nucleic acids - used to develop products
                            Genetically modified Pseudomonas strains - useful to protect crop plants by controlling or inhibiting plant pathogen growth, e.g. growth of Rhizoctonia species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     34.00 Length: 10

Part Stormer or complete measures measures for the process of the sequence vaccines.

Claim 1; Page 1230-1231; 3271pp; English.

Claim 1; Page 1230-1231; 3271pp; English.

Consider of the invention. The DNA sequences are recorded on a computer readable of the invention. The DNA sequences are recorded on a computer readable of the invention. The DNA sequences are recorded on a computer readable of medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM Homology searches using the Saureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are considered and these polypeptides can also be used in a kit for the immunodetection of be used in a vaccine composition against Saureus in mannerous human diseases, including cellulitis, eyelld infections, food poisoning, osteomyelitis, shand surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Location/Qualifiers

7*tag= a /*these bases represent a line of missing text in /*note= "these bases represent in the specification. They are included to maintain the nucleotide numbering given in the specification for this DNA sequence."
activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/ chemotantic activity, haemostatic and thrombolytic activity, recreptor/ ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromsome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or sequence 278 BP; 95 A; 56 C; 58 G; 67 T;

PT DNA constructs for expression of Polyporus laccase enzymes - for use

PT IN e.g. lighth manipulation, juice mfr., phenol polymerisation and phenol resin produ

PT DNA constructs for expression of Polyporus place and the sequence encodes laccase. LCC2 (pI 5.95) from Polyporus pinsitus

CC Trametes villosa). Polymerase chain reaction (PCR) amplification of CT (Trametes villosa). Polymerase chain reaction (PCR) amplification of CT (Trametes villosa).

Converd primer in PCR. Clones are expressed in Aspergillus oryzae, and a cDNA probe is obtained and used to screen a P. pinsutus

CC and a cDNA probe is obtained and used to screen a P. pinsutus

CC and a cDNA probe is obtained and used to screen a P. pinsutus

CC Screening also results in isolation of LCC1 (T15509) and LCC3 (C15600-T15602), which encode different laccases produced by P. CC pinsutus. The laccases may be used to polymerise or oxidise or oxidise or pinsutus and particles and personen in the genome), in the genomely, in the speciallus spp. (with vector integration in the genome), in Aspergillus spp. (with vector integration in the genome), in contrast to previous basidiomycet laccases, which give low yields of the compositions.

CC Contrast to previous basidiomycet laccases, which give low yields of the recombinant enzyme.

Claim 197. Config. and exemplifies the invention. The specification describes config. and exemplifies the invention. The specification describes nucleic acid sequences derived from a cukaryotic chromosome, including a neocentromere or its functional derivative or hybrid, that are able, in a compatible cell, of replicating, acting as extra-chromosomal element and segregating during cell division. The sequences can be used to construct artificial chromosomes for use in gene therapy comprising a replicable, segregating nucleic acid that confers a specific phenotype on cells. Human artificial chromosomes can propagate in human cells and carry large amounts of DNA (e.g. therapeutic genes), and, being extra-chromosomal, they are not mutagenic. The artificial chromosomes can are also useful for generation of transgenic plants and animals, in production of proteins and to make diagnostic reagents, e.g. for expression of cytokines, receptors and growth factors, or to increase the copy number of a gene in a cell. The constructs may also be used for functional and structural analysis of chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          While JP, Purcell RH;

New non-A, -B, -C, -D and -E (n-(ABCDE)) hepatitis.
New catcher of n-(ABCDE) hepatitis.
Disclosure; page 113; 165pp; English.
The sequence represents clone 4B11 which encodes an immunogenic polypeptide associated with non-A, non-B, non-C, non-D, non-E (n-(ABCDE)) hepatitis virus infection, and is obtained by Areparing a phage from a phage lambda gtll library of JFA DNA (ATCC 75271) n-(ABCDE) hepatitis serum, plating to form plaques, and screening the phage plaques for the production of polypeptides
                                                                                                                     New isolated nucleic acid comprising neocentromere sequences from eukaryotic chromosome - used to produce replicable, segregating artificial chromosomes that can carry large amounts of DNA for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       03-JUL-1996 (first entry)

/*tag- a /note- "Residue not given in the specification, included to maintain open reading frame and to encode the amino acid given in the specification at this
immunoreactive with n-(ABCDE) serum. Inserted sequences in gtll
care expressed as beta-galactosidase fusion proteins. Clone 4B11
has 3 multiple insert sequences; each insert can be fractionated
into discrete sequences perstriction enzymes, or portions of the
inserts can be PCR amplified by sequence specific primers. Each
resulting individual region can be subcloned and immunoscreened.
This allows identification of specific regions responsible for
immunoreactivity. n-(ABCDE) hepatitis virus polypeptides can be
used for the production or detection of antibodies, and in
vaccines. The antibodies can be used for detection, diagnosis and
in passive immunotherapy. The DNA can be used in detection and
diagnosis, and as hybridisation probes for identification of
further n-(ABCDE) hepatitis virus coding sequences. Culture systems

The sequences given in T34189-90 encode proteins from the pentachlorophenol (Pop) breakdown pathway, designated Popb and Popk. The Popb gene was found to code for a 323 amino acid polypeptide, mol. wt. 35942 daltons. Based on multiple sequence alignments, Popb belongs to the family of class I dioxygenase electron transport proteins. Popb was predicted to have three structural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PcpD coding sequence.

comains, one involved in binding flavin mononuclectide (FMN), the second responsible for binding reduced NADPH and the third forming a plant-cesponsible for binding reduced NADPH and the third forming a plant-subput flavoprotein-oxidoreductase, and has been designated the PCP 4-monooxygenase reductase. It is transcribed as a dicistronic message with PCPB (see also T44184). The pcpR open reading frame encodes a 303 amino acid protein with a mol. Wt. of 33549 daltons, which possesses a helix turn helix motif in its N-terminal portion. PcpR is thought to activate the transcription of pcpBD and pcpA. In combination with pcpA, pcpB and pcpC, these enzymes catalyse the initial steps of PCP breakdown. These enzymes can specifically be used in the breakdown of PCP containing matter which persists in the environment and in food chains pesticide, and in products such as herbicides and disinfectants.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  restricted P. aeruginosa waaC, waaG, waaF and waaP gene cluster vesful in the diagnosis or treatment of P. aeruginosa infections claim 2; Fig 6; 6ipp; maplish.

This is the nucleotide sequence of the waaF gene (rfaF gene) of the waa gene cluster of Pseudomonas aeruginosa PAO1. It codes for WasZ11), a heptosyl transferase II that adds the second heptose residue onto the core oligosaccharide in the biosynthesis of the the lipopolysaccharide inner core. The four waa genes of P. aeruginosa (see V84116-19) are arranged contiguously in an operon with the gene order waaF, waaC, waaG and waaP. The functions of the encoded proteins (see W82210-13) were tested by complementation of specific Salmonella typhimurium mutants, and knockout mutations of the genes in P. aeruginosa. The waa nucleic acids or proteins can be used to diagnose a bacterial, especially a percent for compounds that affect core lipopolysaccharide biosynthesis or assembly. A claimed method of treating or preventing a bacterial infection infection comprises administering an agent that inhibits a waa gene to na mainmal. A claimed wackine for treating a bacterial infection companies or WaaF, waaG, waaG, 364 G; 178 T; sequence 1038 BP; MaaC, WaaF and WaaG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pseudomonas acruginosa héptosyl transferase II waaf gene.

The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Center project name: 12959

requests: clonerequest@sanger.ac.uk
On Nov 27, 1999 this sequence version replaced gi:6066017.
IMPORTANT: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in
progress and the release of this data is based on the understanding
that the sequence may change as work continues. The sequence may
be contaminated with foreign sequence from E.coli, yeast, vector,
phage etc. Order of segments is not known; 800 n's separate

It currently consists of 7 contigs. The true order of the places is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will

* NOTE: This is a "working draft, sequence. It currently

* NOTE: This is a "working draft, sequence. It currently

* Consists of 34 contigs. The true order of the pleces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

of Mycobacterium leprae
Mol. Microbiol. 7 (2), 197-206 (1993)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  in codons is given for each CDS.
Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Etudes des Genomes (GIP-GREG).
Details of M. Leprae sequencing at the Sanger Centre are available on the World Wide Web

yette="MLCB2533.01c, ansp, probable L-asparagine permease, partial CDS, len: >366 aa, highly similar to many amino-acid permeases e.g. ANSP_SALTY (EMBL.004851)
S.typhimurium Ansp, L-asparagine permease (L-asparagine transport protein) (497 aa), fasta scores: opt: 1508 z-score: 1696.8 E(): 0, 61.2% identity in 366 aa overlap. Equivalent to M.tuberculosis Rv2127, ansp (MTC261.26, 85.7% identity in 356 aa overlap). Also similar to M.tuberculosis permease Rv0346c, arop2 (MTC13E1.06c, 75.1% identity in 356 aa overlap). Probable integral membrane protein, contains PS00218 Amino acid permeases signature. Pfam match to entry PF00324 aa_permeases, amino acid permease. Annotated as ORF TR:049801, designated arop2 in M.leprae cosmid EMBL:00017"
The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. All CDS over 100 codons have been analysed. Gene prediction is based on positional base preference in codons especially where there is an increase in the observed/expected third position G + C. CAUTION: We may not have predicted the correct initiation G + C. CAUTION: We may not have predicted the correct initiation odon. Where possible we choose an initiation codon (aty, gtg, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon. If this cannot be identified we choose the most upstream initiation codon.

IMPORTANT: This sequence MAN NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small location/qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GTGLFLGAGGRLAKAGPGLFLVYAVCGVFVFLILRALGELVLHRPSSGSFVSYAREFF

permease, len: 505 aa; highly similar to many amino-acid permeases e.g. ANSP_SALTY (EMBL:004851) S.typhimurium AnsP, L-asparagine permease (L-asparagine transport protein) (497 aa), fasta scores; pot: 1891 z-score: 2218.9 E(): 0, 58.9% identity in 477 aa overlap. Equivalent to M.tuberculosis Rv2127 (MTCY261.26, 83.7% identity in 485 aa overlap). Also similar to M.tuberculosis permease Rv0346c (MTCY13E10.06c, 69.8% identity in 473 aa overlap). Probable integral membrane protein, contains PS00218 Amino acid permeases signature. Pfam match to entry PF00324 aa_permeases, amino acid permease. Annotated as ORF 7R:049802, designated lysp in M.leprae cosmid EMBL:00017"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         complement(2903..3856)

Sequencing of Drosophila melanogaster
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Submitted (14-JUN-1999) Drosophila Genome Center, Lawrence Berkeley Laboratory, MS 64-121, Berkeley, CA 94720, USA on Nov 23, 1999 this sequence version replaced gi:5670524.

For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu. All contigs in this submission meet the following cutoffs: length >= 200 bases.

* NOTE: This is a "working draft' sequence It currently a consists of 99 contigs. The true order of the places

* is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Celniker, S.E., Agbayani, A., Arcaina, T.T., Baxter, E., Blazej, R.G., Butenhoff, C., Champe, M., Chavez, C., Chew, M., Clesiolka, L., Doyle, C.W., Farfan, D.E., Galle, R., George, R.A., Harris, N.L., Hoskins, R.A., Houston, K.A., Hummasti, S.R., Karra, K., Kearney, L., Kim, E., Lee, B., Lewis, S., Li, P., Lomotan, M.A., Mazda, P., Pfelffer, B., Poon, L., Sequelra, A., Nath, F., Syriskas, R.R., Wan, K.H., Weinburg, T., Zhang, R., Zieran, L.L. and Rubin, G.M.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         contig of 524 bp in length

8 Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

* NOTE: This is a 'working draft' sequence. It currently consists of 89 contigs. The true order of the pleces

* is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             **

* NOTE: This is a 'working draft' sequence. It currently * consists of 2 contigs. The true order of the pieces * is not known and their order in this sequence record is * arbhirary, Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence * as soon as it is available and the accession number will * be preserved.

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

```
standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
STSS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
                                                                                                                                                                                                                                                                                                                                                                                                              QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.

ON NOV 15, 1999 this sequence version replaced gi:605524.

IMPORTANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence as in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coll, yeast, vector, phage etc. Order of sequence is not known; 800 n's separate sequents: Infinished: ba392M18 Contig_ID: 00029 acc=AL121897 Length: 1432 bp Unfinished: ba392M18 Contig_ID: 00029 acc=AL121897 Length: 1677 bp Unfinished: ba392M18 Contig_ID: 00029 acc=AL121897 Length: 1677 bp Unfinished: ba392M18 Contig_ID: 00289 acc=AL121897 Length: 100213 acc=AL121897 Length: 1104 bp Unfinished: ba392M18 Contig_ID: 00289 acc=AL121897 Length: 1104 bp Unfinished: ba392M18 Contig_ID: 00289 acc=AL121897 Length: 10037 acc=AL121897 Length: 1104 bp Unfinished: ba392M18 Contig_ID: 00289 acc=AL121897 Length: 10037 acc=AL121897 Length: 1107 bp Unfinished: ba392M18 Contig_ID: 00289 acc=AL121897 Length: 100437 acc=AL121897 Length: 1107 bp Unfinished: ba392M18 Contig_ID: 00480 acc=AL121897 Length: 100480 acc=AL121897 Length: 1107 bp Unfinished: ba392M18 Contig_ID: 00523 acc=AL121897 Length: 1107 bp Unfinished: ba392M18 Contig_ID: 00650 acc=AL121897 Length: 314 bp Unfinished: ba392M18 Contig_ID: 00650 acc=AL121897 Length: 314 bp Unfinished: ba392M18 Contig_ID: 00650 acc=AL121897 Length: 314 bp Unfinished: ba392M18 Contig_ID: 00650 acc=AL121897 Length: 1107 bp Unfinished: ba392M18 Contig_ID: 00650 acc=AL

The synthetic immunoglobulin binding proteins derived from protein L comprise repeated sequences from protein L which bind immunoglobulin kappa light chains. They can be used in protein analysis, purification procedures and other biochemical processes e.g. ELISA. The synthetic molecules are of particular advantage if they are free of regions in protein L which exhibit albumin and cell wall binding (The repeat regions commencing at nucleotide numbers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note- "Repeat units are not adjacent, repetitions of this sequence are not 100% homologous and begin at nucleotide position 757"
